

Proposed Solution

Date: 30 September 2026

Team ID: SWTID-2026-4040

Project Name: ComicCraft — AI Comic Story Creator Using Gemini Models

Team Leader: Bala Esakki R

Team Members: Sandhiya D, Rithikaa B, Anitha R, Anbuselvi

Team Size: 5

Maximum Marks: 5

Solution Overview

ComicCraft is an AI-powered web application that accepts a comic idea and related creative controls, generates a five-panel outline with Gemini Flash, expands the outline using Gemini Pro, creates panel images with Stable Diffusion, assembles the results into a layout, and presents a browser preview with an export-success flow.

End-to-End Workflow

User Input → FastAPI Route → Gemini Flash Outline → Gemini Pro Story → Stable Diffusion Images → Layout Builder → Comic Preview → Export Flow

Key Benefits

- Combines narrative and visual generation in one workflow.
- Uses separate AI stages so outline generation and story expansion have distinct responsibilities.
- Uses structured panel metadata to support consistent layout.
- Provides a simple browser interface through Jinja2 templates.
- Can be extended with persistent storage, user accounts, more panel controls and richer export.

Current Scope Note

The uploaded code contains image-generation and PDF-related components, but the provided export function referenced by routes is not present in the uploaded file list. The submission therefore documents the export flow as an intended integration point rather than claiming a verified end-to-end PDF export implementation.
