

Coding & Solution

Date: 30 September 2026

Team ID: SWTID-2026-4040

Project Name: ComicCraft — AI Comic Story Creator Using Gemini Models

Team Leader: Bala Esakki R

Team Members: Sandhiya D, Rithikaa B, Anitha R, Anbuselvi

Team Size: 5

Maximum Marks: 5

Implemented Solution Flow

The uploaded implementation uses FastAPI as the application entry point. The POST /generate route receives story_prompt, character_name, setting, tone and art_style. It then calls generate_outline(), generate_story(), generate_image() for each outline item, build_comic_layout(), and finally the referenced save_pdf() exporter before rendering comic_preview.html.

AI Integration

- Gemini 1.5 Flash is used to request a five-panel outline.
- Gemini 1.5 Pro expands outline entries into narration and dialogue.
- Stable Diffusion v1-5 is loaded through Hugging Face Diffusers and PyTorch for image generation.
- The API key is read from GEMINI_API_KEY in the environment.

Important Implementation Observation

The uploaded routes module imports app.gemini_flash, app.gemini_pro, app.image_generator, app.layout_builder and app.exporters, while the ZIP contains the corresponding numbered modules but does not contain an exporters.py file in the supplied file list. The project should align import paths/package structure and add or correct the exporter before claiming a fully runnable production build.
